Banking under large excess reserves

WITH PAUL RINTAMÄKI, AALTO

UNIVERSITY

ABSTRACT: We examine the effects of quantitative easing (QE) on bank lending in the Eurozone. QE has substantially increased central bank reserves held by commercial banks and raised the volume of short-term wholesale deposits, which made bank funding less stable. Basel III regulation complicates how large volumes of excess reserves and short-term wholesale deposits influence bank lending. We develop a structural model incorporating imperfect competition in credit and deposit markets and regulatory costs that escalate as banks approach minimum requirements. This framework allows us to quantify how excess reserves contribute to regulatory costs. In France, QE increased the marginal cost of long-term lending by 16 basis points in Q4 2021. Counterfactual analysis indicates that maintaining central bank reserves at 2 trillion euros instead of 4 trillion could have boosted aggregate bank lending by approximately 5% in Q4 2021.

Quantitative easing, inelastic markets and the transmission of asset Purchases

WORKING PAPER

ABSTRACT: I study the impact of asset purchases on the composition of institutional bondholders portfolios, and how this acts as a transmission mechanism for quantitative easing: As the price of assets targeted by the purchases rises, investors search for yield and will purchase untargeted assets, in turn pushing up their price. I propose a mechanism where institutional bond- holders take advantage of financial frictions before this transmission of policy takes place. When asset purchases increase, institutional bondholders will first build up an inventory of specific bonds targeted by the purchases, diminishing the bonds available free float to squeeze out a profit from the Central Banks buying up the bonds. In a second phase, as prices for targeted assets stabilize, institutional bondholders will rebalance their portfolio towards bonds untargeted by the purchases as they search for yield, thereby transmitting quantitative easing to untargeted markets.

The determinants of director selection: Relationships in the director market

WORKING PAPER

ABSTRACT: When landing a board of directors job, a significant portion of external candidates enjoys preexisting relationships with members of the board. These relationships may be entirely fortuitous, could reflect self-serving behavior on behalf of board members, or simply be used as a screening device to recruit individuals in extremely competitive positions. This paper uses a consideration sets framework to disentangle these explanations. I argue that estimates of the impact of pre-existing relationships on a directors probability of appointment are biased upwards in the literature. I make additional observations of the impact of a directors personal network on her likelihood of appointment.

The effect of asset Purchases on the liquidity of the bond market

WORKING PAPER

ABSTRACT: I develop a theoretical model to analyze the impact of central bank intervention on the long run price of a bond. Bonds are defined as tradable debt assets that are set to be repaid after n periods and incur a default risk. Bondholders on the market incur a liquidity risk and might need to liquidate their assets, which can lead to market breakdown during a liquidity crisis. Central Bank intervention through asset purchases (QE) leads to price stabilization during QE, but at the cost of a long-run shift in prices and over-payment by the Central Bank. This leads to overborrowing in equilibrium after intervention. Reversing asset purchases through quantitative tightening will lead to a market crash as overborrowing firms become insolvent due to the shift of bond prices back to their steady state.

What you see is what you get paid: Transparency and CEO pay

WORKING PAPER

ABSTRACT: This paper presents a simple model of CEO compensation where salary is dependent on the internal characteristics of the firm and where the salary of one CEO exerts a positive externality on the salary of others. CEOs are considered interchangeable but costly to recruit outside the market, and are randomly matched with firms until they accept the firms offer. Different firms having different levels of monitoring, prestige and being part of different industries, CEOs enjoy different levels of private benefit when shirking in different firms. Using this model, we can shed light on how the degree of transparency affects CEO compensation. In equilibrium, some of the CEOs have their participation constraint binding while the others have a binding incentive compatibility constraint. A change in the degree of transparency moves the participation constraint, inducing a change in wage for some CEOs. We find that the wage is more likely to increase than it is to decrease.
